PROMOTED

An advertisement for Amazon's 'Gold Box Handpicked Deals'. The background is a dramatic photograph of a stormy sky with multiple bright lightning bolts striking down over a dark landscape. In the foreground, a road with a few orange traffic cones is visible. On the left side, there is a red box with a white ribbon icon and the text 'AMAZON GOLD BOX HANDPICKED DEALS'. Below this, there is a blue link 'Save on top deals every day', a white 'Shop Now' button with the Amazon logo, and a green link 'Save the most'.

Researchers found the method can effectively detect 'comma-shaped' clouds with 99% accuracy

## **New York:**

Using Artificial Intelligence (AI), researchers have developed an algorithm to detect cloud formations that lead to storms, hurricanes and cyclones.

The study, published in the journal IEEE Transactions on Geoscience and Remote Sensing, shows a model that can help forecasters recognise potential severe storms more quickly and accurately.

The researchers created a framework based on Machine Learning (ML) -- a kind of AI -- that detects rotational movements in clouds from satellite images that might have otherwise gone unnoticed.

"The very best forecasting incorporates as much data as possible, there's so much to take in as the atmosphere is infinitely complex. By using the models and the data we have, we're taking a snapshot of the most complete look of the atmosphere," said Steve Wistar, Senior Forensic Meteorologist at AccuWeather in the US.

For the study, researchers analysed more than 50,000 US weather satellite images and identified and labelled the shape and motion of 'comma-shaped' clouds.

These cloud patterns are strongly associated with cyclone formations which can lead to severe weather events including hail, thunderstorms, high winds and blizzards, they said.

Then, using computer vision and ML techniques, the researchers taught computers to automatically recognize and detect 'comma-shaped' clouds in satellite images.

The computers could then assist experts by pointing out in real time where, in an ocean of data, could they focus their attention in order to detect the onset of severe weather.

"Because the 'comma-shaped' cloud is a visual indicator of severe weather events, our scheme can help meteorologists to forecast such events," said study lead author Rachel Zheng from Penn State University in the US.

The researchers found that their method can effectively detect 'comma-shaped' clouds with 99 per cent accuracy, at an average of 40 seconds per prediction.

It was also able to predict 64 per cent of severe weather events, outperforming other existing severe weather detection methods.

This research is an early attempt to show feasibility of AI-based interpretation of
